FOREWORD

The Electromagnetic Compatibility Analysis Center (ECAC) is a Department of Defense Facility, established to provide advice and assistance on electromagnetic compatibility matters to the Secretary of Defense, the Joint Chiefs of Staff, the military departments and other DOD components. The Center, located at North Severn, Annapolis, Maryland 21402, is under executive control of the Director of Defense Research and Engineering and the Chairman, Joint Chiefs of Staff or their designees who jointly provide policy guidance, assign projects, and establish project priorities. ECAC functions under the direction of the Secretary of the Air Force and the management and technical direction of the Center are provided by military and civil service personnel. The technical operations function is provided through an Air Force sponsored contract with the IIT Research Institute (IITRI).

This report was prepared as part of AF Project 649E under Contract F-19628-70-C-0291 by the staff of the IIT Research Institute at the Department of Defense Electromagnetic Compatibility Analysis Center.

To the extent possible, all abbreviations and symbols used in this report are taken from American Standard Y10.19 (1967) "Units Used in Electrical Science and Electrical Engineering" issued by the United States of America Standards Institute.

The cooperation of FAA staff members, in particular, Mr. R. Johnson of the Spectrum Plans and Programs Branch, was essential to the performance of this study.

Users of this report are invited to submit comments which would be useful in revising or adding to this material to the Director, ECAC, North Severn, Annapolis, Maryland 21402, Attention ACV.

ABSTRACT

As an aid to spectrum planning, estimates of the minimum channel requirements for the Instrument Landing System localizer are obtained for the 1970-1975 time period. Several alternatives in antenna systems, service volumes, assignment criteria and operational procedures are considered with respect to their possible impact on channel requirements.

SECTION 1**INTRODUCTION**

The Instrument Landing System (ILS) provides low-altitude approach radionavigation service to aircraft landing at air terminals. In 1975, according to Federal Aviation Administration (FAA) projections, the number of ILS facilities at air terminals in the continental United States and near-by parts of Canada and Mexico will be more than double the number currently installed. From the spectrum management point of view, with only 20 channels in the 108-112 MHz frequency band allocated for ILS localizer assignments, the projected growth in the number of ILS facilities raises the question of the inadequacy of the present allocation of channels for ILS service to accommodate future needs. The objective of this analysis is to obtain estimates of the minimum channel requirements for ILS facilities in the 1970 to 1975 time period, thereby providing a basis for determining both the necessity and timing for implementing appropriate measures to cope with the impending spectrum congestion.

In estimating the minimum channel requirements, the two primary factors to be considered are (1) the total ILS implementation and (2) the co-channel assignment constraints. A specification of the current and projected ILS facilities, including locations and orientations, in the 1970 to 1975 time period was provided by the FAA for the purposes of this study. The co-channel assignment constraints for ILS facilities depend on several factors: service volumes, antenna systems, airport operational procedures and the assignment criteria. Alternatives in each of these factors are considered. Details on the ILS complexes and channel assignment constraints employed in this study are set forth in SECTION 2. The results of the study, which consists of estimates of the minimum ILS channel requirements, are also presented in SECTION 2.

SECTION 2

RESULTS AND ANALYSIS

SUMMARY OF RESULTS

The primary results of this study are summarized in TABLE 2-1. Estimates of the minimum number of distinct channels are provided for the current (1970) ILS complex and for three possible future ILS complexes. For each complex, the minimum channel requirements are estimated for co-channel assignment constraints derived from alternative possibilities in the antenna system employed for the ILS localizer, the service volume provided by the ILS for approaching aircraft, and the assignment criteria employed to protect the ILS signal within its service volume. In addition, two alternatives in airport operational procedure are considered. In the first case, ILS facilities on the same runway but serving opposite approach directions are required to operate on different channels. The minimum channel requirements, if this condition is imposed, are given by the upper number of each entry in the table. If co-channel operation for such facilities is permitted, then the minimum channel requirements are indicated by the lower number of each entry in the table. Details for each of the factors on which these estimates of minimum channel requirements depend are discussed in the following subsections.

AIR TERMINAL COMPLEXES

Four air terminal complexes and their associated ILS facilities, located in the continental United States and nearby parts of Canada and Mexico, are considered for the 1970 to 1975 time period. These are the current 1970 ILS implementation and the projected ILS implementations for the years 1973 and 1975. The fourth ILS complex considered consists of the 1975 complex with the addition of ILS facilities for eighteen high-capacity air terminals, or so-called superports, which may be realized by 1975. The specification of the numbers, locations and orientations of the ILS facilities in each case was provided by the FAA for the purposes of this study and were drawn from their planning documents on future requirements for ILS service at air terminals. A complete listing of the ILS complex is given in Appendix I.

The number of air terminals, runways and ILS facilities in each complex is given in TABLE 2-1. It should be noted that while the number of ILS facilities more than doubles from 1970 to 1975, the number of ILS equipped runways increases by only about fifty percent, so that a significant part of the increase in ILS facilities consists of providing an additional ILS facility for a runway already equipped for one-way service. This fact

accounts for the relatively significant reduction in the 1975 ILS complex channel requirements when opposing ILS facilities on the same runway are permitted to operate co-channel as compared with the case of requiring different channels.

Considerable uncertainty surrounds the location and orientation, not to mention the possible realization, of the superports and their associated ILS facilities. The 1975 complex with superport facilities is included here, however, to estimate the impact on the ILS channel requirements in the event such high-capacity air terminals are implemented. The unexpectedly high estimate of a minimum of 50 channels (see TABLE 2-1) required for this air terminal complex is, in part, due to the superports at Baltimore, Washington (Dulles) and Philadelphia. Under the indicated co-channel assignment constraints and the particular runway orientations selected, each of the 36 ILS facilities at these three superports would require a distinct channel.

CO-CHANNEL ASSIGNMENT CONSTRAINTS

The co-channel assignment constraints applicable to ILS facilities are primarily determined by three factors: (1) the antenna system used for the ILS localizer, (2) the service volume over which the ILS signal must be protected, and (3) the assignment criteria employed to provide the necessary level of signal protection from other potentially interfering co-channel ILS facilities.

Two antenna systems are considered: the 8-loop antenna system and the more directional V-ring antenna system. Both are in current use for ILS operations, however, only a very few V-rings have been implemented. Although designed primarily to combat multipath propagation problems, the directional properties of the V-ring do have some influence on the co-channel assignment constraints and hence, on the channel requirements for the ILS complex. To see this effect, two cases were considered in evaluating the minimum channel requirements for each of the ILS complexes. In the first case, all ILS facilities are considered to employ 8-loop antennas exclusively, and in the second case, V-ring antennas are employed exclusively. From TABLE 2-1, it appears that the directivity of the V-ring antenna system resulted in some reduction of channel requirements over the 8-loop antenna for comparable service volumes and assignment criteria.

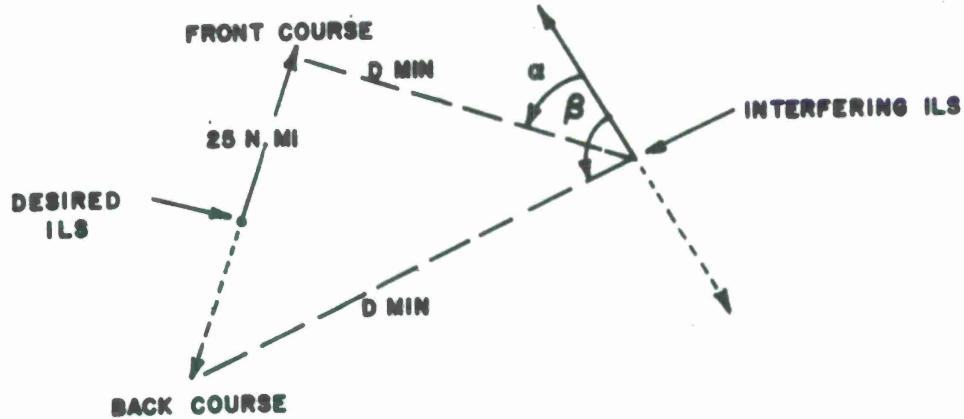

The next factor affecting the co-channel assignment constraints is the service volume. Two cases are considered. In the first case, referred to as the standard service volume, the ILS provides service for distances out to 25 nautical miles (nmi) along the centerline of the

runway in the approach direction and for altitudes to 6250 feet. In the second case, referred to as the reduced service volume, the distances and altitudes are reduced to 18 nmi and 4500 feet, respectively. In each case, the ILS must also provide similar service in the opposite direction for missed or aborted approaches and for backcourse approaches. The reduced service volume is now under consideration for adoption by the FAA to replace the standard service volume. As reflected in TABLE 2-1, the reduced service volume, if adopted, will significantly reduce the channel requirements for the future ILS complex.

The third factor influencing the co-channel assignment constraints is the assignment criteria, i.e., the level of protection afforded an ILS signal within its service volume from potential interfering co-channel sources. Three sets of assignment criteria are considered. The first case represents current FAA practice in assigning channels to ILS facilities with standard service volumes (Reference 1). In this case, signal-to-interference ratio (SIR) predictions originally derived for VOR systems are employed to determine the minimum distance separation between the aircraft receiver at the extremes of the service volume of one ILS facility and the transmitter location of another potentially interfering co-channel ILS facility so as to maintain a SIR of at least 20 dB with 95% reliability (i.e., 95% of the time). In TABLE 2-1, the top line of entries indicates the minimum channel requirements if this criterion is continued to be used in the future. The remaining two assignment criteria also employ 20 dB of signal protection at 95% reliability, but in addition allow for a 3 dB drop in transmitter power for the desired ILS signal. In these cases, estimates of channel requirements are obtained for both the VOR SIR predictions, in the event these are continued in use, and for the more recently proposed ILS SIR predictions (Reference 2).

An adjustment was made to the data for ILS SIR predictions in Reference 2 by adding 3 dB to the ILS aircraft receiver antenna gain for the desired signal. This was necessary to overcome the apparent 3 dB discrimination in favor of an interfering signal implicit in the antenna statistics employed in Reference 2. The adjustment was not necessary when using the VOR SIR prediction data criteria. The newly proposed ILS assignment criteria require greater distance separations between potentially interfering co-channel ILS facilities than currently employed criteria and are reflected in the higher channel requirements indicated in TABLE 2-1.

The composite of the three factors (antenna system, service volume and assignment criteria) considered above yields the co-channel assignment constraints in terms of the minimum distance separation between the aircraft receiver at the extremes of the service volume of the desired ILS and the location of each potentially interfering co-channel ILS facility. For the directional antennas employed by ILS facilities, minimum co-channel distance separation depends on the relative orientations of the antennas as indicated by the following diagram.

In this diagram, the signal from the desired ILS must be protected at a point 25 nmi. (18 nmi. for the reduced service volume) in the forward or front course direction (indicated by the solid line) and for the same distance on the back course (dotted line). The power from the interfering ILS in the direction of these critical points depends on the angles α and β . The minimum separation distance for cochannel operation depends on these angles as indicated in TABLE 2-2. The antenna patterns are assumed to be symmetric about the runway centerline.

In addition to the above factors (antenna system, service volume and assignment criteria), airport operational procedures also affect the co-channel assignment constraints. Two cases are considered: (1) two ILS facilities on the same runway, but serving opposite approach directions, are required to operate on different channels, and (2) two such ILS facilities are permitted to operate co-channel. ILS facilities at a common airport but on different runways are always assumed to require different channels in this study. Since approximately half the runways, as specified for this study, have two ILS facilities, the impact on minimum channel requirements of this operational constraint is considerable as indicated in TABLE 2-1.

ESTIMATES OF CHANNEL REQUIREMENTS

The analytical procedure employed in estimating channel requirements is based on graph theoretic concepts. In particular, the classical node-coloring problem of graph theory and the notion of chromatic numbers are related to the problem of determining the minimum number of distinct channels required for a system under a given set of constraints.

This method of analysis, including the basic node-coloring algorithms, is discussed in detail in Reference 3.

It should be emphasized that the estimates obtained in this study are minimum channel requirements under the specified conditions. Departures from these estimates may be expected due to uncertainties in specifying the future airport/runway complex, special operational requirements, terrain, propagation anomalies, etc. Furthermore, an optimal assignment to an evolving airport complex may imply substantial revision to the existing assignments from time to time as new ILS facilities are introduced. To minimize the need to revise assignments, an excess of channels, perhaps 10 to 20 percent, might be necessary.

APPENDIX I

AIRPORT/RUNWAY/ILS DATA

TABLE I-1 contains a list of ILS facilities included in this study. The table indicates the following information:

1. Airport Identifier — airport code name assigned by the FAA.
2. Latitude.
3. Longitude.
4. Not used in this study.
5. Runway Direction — primary landing direction for the runway; e.g., 24L means the landing direction is approximately 240° magnetic, the L indicates the left runway.
6. Runway Magnetic Bearing.
7. ILS Implementation — for the primary direction, 3 indicates facility will be operating in 1973, 5 indicates superport facility, blank indicates facility will be operating in 1975.
8. ILS Station Identifier — station code name assigned by FAA for the primary runway direction (if implemented).
9. ILS Status — for the primary direction, I indicates currently installed; P indicates proposed facility; blank indicates no facility planned.
10. ILS Antenna Type — V indicates V-ring; blank indicates 8-loop (if implemented).
11. ILS Implementation — for the opposing ILS (if any).
12. ILS Station Identifier — for the opposing ILS station on the runway (if implemented).
13. ILS Status — for the opposing ILS.
14. ILS Antenna Type - for the opposing ILS.
15. Frequency — current assignment for ILS in the primary direction (e.g., 1085 – 108.5 MHz).
16. Frequency — current assignment for the opposing direction (if implemented).
17. Location.

13. ABSTRACT <p>As an aid to spectrum planning, estimates of the minimum channel requirements for the Instrument Landing System localizer are obtained for the 1970-1975 time period. Several alternatives in antenna systems, service volumes, assignment criteria and operational procedures are considered with respect to their possible impact on channel requirements.</p>

INSTRUCTIONS

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requester may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
